Abstract

The computer can be used as a tool for committing a crime or be his target. Crime in networks is referred to criminal use of internet networks and is defined as "cyber crime". This is the "act committed against individuals or groups of individuals with a criminal motive in order to damage the reputation of the victim or cause the victim's physical or mental damage, directly or indirectly, by using modern telecommunication networks like the Internet and mobile telephony.

In a society that is being built more more on technological and computer bases, virtual roles in everyday world existence are becoming more and more essential. Through the advantages offered by computer technology in the profession, market and government, using and applying computer technology has now involved a increased risk. use and application of computer technology has now included an increase in risk. This risk is related to crimes that occur throughout the world via the Internet.

To prevent and punish international terrorism should elaborated an effective legislative base, not only by a single state. The international community must operate together in this sector in order to identify violations who belong to terrorist activities and those who work outside the treaties, in order to deal with their specific categorization.

Keywords: *computer, cyber crime, legal norms, the international community.*
